

CLAIMS

1. An electronic chip card with a view using it
as a server by means of a terminal to which it is
connected in a digital data transmission network such
as the Internet, the said electronic chip card
comprising a microprocessor (50), and memories (52, 54,
56) containing programs and data for implementing the
operating system of the electronic chip card and for
managing the inputs/outputs of the electronic chip
card, characterised in that it also comprises:

- means (56, 70) for translating the commands
coming from the terminal (10, 16) into elementary
commands of the electronic chip card,

- means for performing the operations defined by
the elementary commands, and

- means for formatting the response from the
electronic chip card to the terminal (10, 16).

2. An electronic chip card according to Claim 1,
characterised in that the means for translating the
commands comprise a look-up table (70) for the URLs
which is specific to each type of chip card.

3. An electronic chip card according to Claim 2,
characterised in that the means for translating the
commands comprise in addition a URL interpreter program
(64) recorded in a memory (52).

4. An electronic chip card according to Claim 3,
characterised in that it also comprises means (28, 30)
